

SpecFlow Pre-Work

Ken Pugh, Inc.

Pre-Work

This pre-work ensures that your workspace is configured to run SpecFlow.

1. Go to <https://docs.specflow.org/projects/specflow/en/latest/Getting-Started/Getting-Started-With-A-New-Project.html>
2. Install the Visual Studio Extension for your version. NOTE: SpecFlow does not work with Visual Studio 2015.
3. Create a SpecFlow project.
4. Run All Tests (under Test menu item)
5. View the Output from Tests. You should see a message to set up a SpecFlow account. The details are here: (<https://specflow.org/blog/introducing-the-specflow-account/>).

Now you have two alternatives:

- Finish the Calculator example as described on the web page (if you have time)
- OR
- Go to CalculatorStepDefinitions.cs
 - Delete every occurrence of `_scenarioContext.Pending();`
 - Add **`using Microsoft.VisualStudio.TestTools.UnitTesting;`**
 - In the method `ThenTheResultsShouldBe()` insert
 - `Assert.AreEqual(1,0);`
 - Run All Tests. You should see Red
 - Change line to read:
 - `Assert.AreEqual(1,1);`
 - Run All Tests. You should see Green
